Re: Testimonial Letter for Interface Construction Corporation

Dear Judges:

Washington University (WU) and Washington University School of Medicine (WUSM) play a very active role in shaping many aspects of the St. Louis Region including research, education, and economic development. Together, WU and WUSM were responsible for directing over \$100 million of construction in 2005. Many of the projects have a direct impact on Cancer research and the Biotech Industry, which stimulate the economic growth of the St. Louis Region. Interface Construction Corporation is one of WU's and WUSM's most trusted and valued construction partners.

The Construction Keystone Awards are designed to honor construction firms that consistently overcome challenges in the field and positively impact the surrounding community. Interface Construction Corporation exemplifies the type of company that adds to the value and attractiveness of our community.

The new Radiation Oncology laboratory will contribute to the advancement of cancer research in the St. Louis Region. With their usual problem-solving skill, Interface Construction transformed a cramped, outdated, inefficient space into a state-of-the-art laboratory that could be the site of the next cancer breakthrough. In spite of the complexity and unforeseen structural issues, the project was executed economically, safely, timely, and without disrupting users in adjacent laboratories. The initiative, innovation, and construction capability demonstrated on the Radiation Oncology laboratory project is what WUSM has come to expect from Interface Construction.

Sincerely,

Richard Schaefer  
Director, Design and Construction
